Normal run
no faults · trains Drain and all detectors
Validation fault run
18 episodes · selects g, τ and baseline thresholds
Test fault run
18 episodes, new schedule · evaluation only
train 19,635 windows
held-out 4,918
one fault episode (validation and test runs)
normal traffic
fault active (≈ 90 s)
excluded 60 s
normal traffic (gap ≈ 2 min)
sliding windows (stride 8 keys)
labelled anomalous if it overlaps the fault and belongs to the faulted service or a (transitive) caller
user-visible failure = failed prober request (3 pages, 0.5 s pause, 3 s timeout)
